

Let's Play With Candy

Problem

Submissions

Discussions

Hablu has a box with candies labeled 0, 1, 2, ... He gives Bablu a list of n candy labels (some labels may duplicate). **It is guranteed that, the candies lables will be given in ascending order.**

Now, Bablu must pick **one candy** to eat that **is not in the box**. He wants to pick the smallest **non-negative integer** label possible (so he wastes as little as possible).

What label should Bablu pick?

Input Format

First line: a single integer n — the number of candies in the box

Second line: n space-separated integers A_i — the candy labels

Constraints

$$1 \leq n \leq 10^5$$

$$0 \leq A_i \leq 10^9$$

Output Format

A single integer m — the smallest non-negative integer label **not present in the box**

Sample Input 0

```
5
0 1 2 3 4
```

Sample Output 0

```
5
```

Explanation 0

The smallest non-negative integer not present is - 5

Sample Input 1

```
7
0 0 1 2 2 4 6
```

Sample Output 1

```
3
```

Explanation 1

The missing non-negative integers are - 3, 5, 7, 8.... so on.

From that the smallest one is - 3

Contest ends in 1 hour 12 minutes 38 seconds
